

D.T. TOURISM AGENCY (DTTA) MVP: Bali Mapping

Technical and Functional Specifications for the Pilot Launch

By: Manus AI (for Monkey and Gorilla) **Objective:** Define the concrete steps for the DTTA MVP launch, focused on the Bali region (Trillion Sunny Island).

1. MVP Objective: Proof of Concept for Tourist PoE

The MVP aims to prove the feasibility of **Proof-of-Esentya (PoE)** applied to equitable tourism.

- **Pilot Zone:** Bali (around Trillion Sunny Island).
 - **Estimated Duration:** 30 days (after the Essentios MVP launch).
 - **Success Criterion:** Validation of 100 service transactions (tourist-guide) via the `PoE_Beacon_Manager` on the DTC testnet.
-

2. Key MVP Components

Component	Description	Role in the MVP
Virtual Mapping	Creation of a virtual map of Bali (Frontend) overlaid on the real map. Points of interest (temples, restaurants, yoga centers) are Quest Points .	Visual interface of the D.Quest game for Explorers.
Quest Points (RWA NFTs)	Tokenization of 20 to 30 local services (temple guide, cooking class, diving) into RWA NFT Quests .	Real services become game items.
Local Pod (Bali)	Creation of the first Local Pod (mini-DAO) for the DTTA.	Manages the onboarding of the first 10 Guardians of the Place (local guides).
PoE Beacon Manager	The CosmWasm Smart Contract that manages physical presence validation.	The technical core of the MVP. Validates the tourist-guide transaction.

3. Functional Scenario (The Sadhaka Traveler)

The MVP focuses on the experience validation scenario.

Step 1: Service Acquisition (Quest)

1. The **Sadhaka Traveler** consults the virtual map of Bali and selects a service (e.g., "Trek to Mount Batur with Guardian Wayan").
2. They pay for the service in **\$D.Flow** via the application. The `Equitable_Travel_Pod` locks the funds.

Step 2: Experience Validation (PoE)

1. The Traveler and Guardian Wayan meet at the starting point.
2. Guardian Wayan activates the `Start_Service()` function on their application.
3. At the end of the service, the Traveler activates the `Validate_Experience()` function.
4. The `PoE_Beacon_Manager` verifies:
 - The **Proximity** of the two devices (via BLE/GPS).

- The **Duration** of the service (aligned with the estimated time).
- The **Signature** of both parties on the blockchain.

Step 3: Compensation and Karma

1. If validation is successful, the `Equitable_Travel_Pod` releases the funds (\$D.Flow) to Guardian Wayan.
 2. The Traveler leaves a comment and a rating. This action is an **Event** that feeds the `DharmaPulse` and increases the Guardian's **Karma**.
-

4. Technical Specifications of the PoE MVP

Specification	Technical Detail	Implication
Smart Contract	<code>PoE_Beacon_Manager</code> (CosmWasm)	Manages the public keys of the Guardians and the coordinates of the Quest Points.
Validation	Triple Verification: GPS + BLE + Timestamp	Minimizes geolocation fraud.
Stored Data	Transaction Hash, Guardian ID, Traveler ID, Rating/Comment (Holocron Hash).	No personal data is stored, only proof of the interaction.
D.Quest Link	Successful validation unlocks a "Bali Explorer" Soulbound NFT for the Traveler.	The game and reality are merged.
